| 7.3 Replacement of Vulnerable Parts .....                 | - 82 -        |
| 7.4 Storage .....   | - 82 -        |
| <b>Appendix: Modbus Communication Protocol .....</b>      | <b>- 83 -</b> |

# Chapter 1 Safety Information and Precautions

To ensure safety of your health, equipment and property, please read this chapter carefully before using the frequency inverter and act in compliance with the instructions when installing, Debugging, running and overhauling the frequency inverter.

## 1.1 Safety Definition

Danger: it will cause danger of serious injuries and even death while operating against the rules.

Caution: it will cause danger of light injuries or equipment destruction while operating against the rules.

Note: some information is useful while operating and use frequency inverter.

## 1.2 Safety Requirements and Cautions

### •Before Installation

#### Danger

Only qualified personnel can operate the equipment. Before operating, be sure to carefully read the manual about safety, installation, operation and maintenance.

The safe operation depends on the proper processes of choosing models, carrying, installation, operation and maintenance.

#### Danger

Don't use the damaged or incomplete frequency inverters; Otherwise, there is risk of injury.

### •Installation

#### Danger

- 1) Please install the frequency inverter on metal or other nonflammable material, and keep it away from the combustible material. Otherwise there is danger of fire;
- 2) No unauthorized modification to the frequency inverter; Otherwise there is danger of damaged.
- 3) Normal frequency inverter, which is not explosion-proof, can not be installed where with explosive gas or dust; Otherwise there is danger of explosion.

**Attention**

- 1) When two frequency inverters are installed in the same control cabinet, please pay attention to the installing place to guarantee the effective heat dissipation.
- 2) When carrying the frequency inverter, ease support its bottom.

•**Wiring**

**Danger**

- 1) Wire is connected only when the main circuit is cut off, otherwise there is a danger of shock.
- 2) Wire is connected by professional person only. Otherwise there is a danger of shock.
- 3) Earth must be reliable. Otherwise there is a danger of shock.
- 4) AC power supply should not be connected with output ports U, V, W, otherwise there is a danger of damage to inverter.

### 1.3 Cautions in Using

- 1) In application of this series frequency inverter, you have to confirm all machine insulation to prevent damage to the equipment. Moreover, when the motor working in tough environment, please periodic inspect the electrical insulation to ensure the safety of the system work.
- 2) If the motor adapter is not consistent with frequency inverter's rating current (The rating current of the motor is far smaller than that of frequency inverter), please adjust the protective value to ensure safe running.
- 3) In occasions such as load raises, usually there is negative torque and frequency inverter breaks off for over-current or over-voltage. In this case, you should consider choosing the matching brake unit.
- 4) Frequency inverter, in a certain output frequency range, can meet the mechanical resonance of the load equipment. To avoid it, you can set up jumping frequency.
- 5) As output voltage of the inverter is pulse-wave type, if there is capacity which can improve power factor or pressure-sensitive resistance which used for thunder-proof in the voltage output side, the frequency inverter will break off or its parts will be damaged, so it is necessary to dismantle them. Moreover, it is proposed not install switch parts like air switch and contactor (if it is necessary to install switch on output side, please make sure the output electricity of frequency inverter is zero when the switch is working)
- 6) At over 1,000 meters altitude, the inverter's heat dissipation function worsened due to the thin air, it is necessary to use less.
- 7) The inverter output voltage is pulse wave type. If using digital multi-meter measurement, deviation of the reading will be great. And the deviation is different by using different type of digital multi-meter. Under normal circumstances, while RMS 380V, digital multi-meter reading is around 450V.

- 8) Solar panel can be connected in the series or parallel. For rated voltage 380V controller, we suggest working voltage between 480V and 560V while MPPT. What means the solar panel open circuit voltage should be between 600V and 700V.

#### **1.4 Cautions in Disposal**

When you dispose frequency inverter please pay attention to:

- 1) Electrolytic capacitor: the electrolytic capacitor of main circuit or the printing plant may explode when they are burned.
- 2) Plastic: plastic incineration may generate toxic gases.
- 3) Dispose method: please dispose as industrial waste.

## Chapter 2 Product Information

### 2.1 Naming Rules

PV300 - 4T - 7.5G (H)

---

①            ②            ③            ④

| Field                | Identification | Label description  |
|----------------------|----------------|--|
| Inverter series      | ①              | PV300 series Solar photovoltaic water pump inverter  |
| Voltage level        | ②              | 1T:Input 90-400VDC, 3 Phase 110-230VAC Output,Suitable for AC110V Pumps<br>2S:Input 150-450VDC,1 Phase150-230VAC Output, Suitable for AC220V Pumps<br>2T: Input 150-450VDC,3 Phase150-230VAC Output, Suitable for AC220V Pumps<br>4T:Input 250-800VDC,3 Phase230-460VAC Output , Suitable for AC380V Pumps |
| Adaptive motor power | ③              | 0.75:0.75kW      1.5:1.5kW      2.2:2.2kW<br>4.0:4.0kW      5.5:5.5kW      7.5:7.5kW   |
| Suffix               | ④              | Support up to 900V input   |

### 2.2 Nameplate

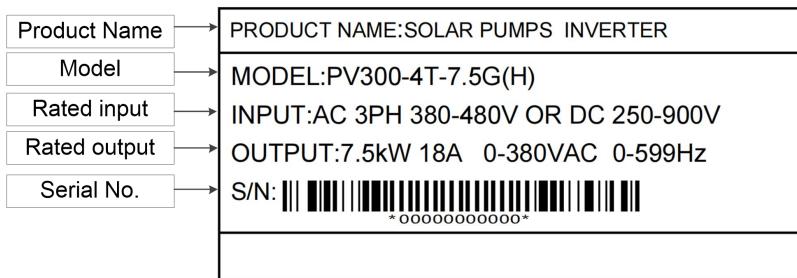

Fig. 2.2-1 Nameplate instructions

## 2.3 Specification and rated parameters

| Solar Pump Inverter Power (kW)  | Pump             |                   | Max solar power input (kW) | Max DC Input Voltage (V) | Recommended Voc voltage (V) | Rated Output Current (A) | Output frequency (Hz) |
|---|------------------|-------------------|----------------------------|--------------------------|-----------------------------|--------------------------|-----------------------|
|   | Rated Power (kW) | Rated Voltage (V) |                            |                          |                             |                          |                       |
| PV300-1T Series:Input 90-400VDC, 3 Phase 110-230VAC Output,Suitable for AC110V Pumps  |                  |                   |                            |                          |                             |                          |                       |
| 0.75  | 0.75             | 110               | 1.0                        | 400                      | 175-380                     | 7.0                      | 0-599.00              |
| 1.5   | 1.5              | 110               | 1.95                       | 400                      | 175-380                     | 10.6                     | 0-599.00              |
| PV300-2S Series:Input 150-450VDC,1 Phase150-230VAC Output, Suitable for AC220V Pumps  |                  |                   |                            |                          |                             |                          |                       |
| 0.75  | 0.75             | 220               | 1.0                        | 450                      | 360-430                     | 4.0                      | 0-599.00              |
| 1.5   | 1.5              | 220               | 1.95                       | 450                      | 360-430                     | 7.0                      | 0-599.00              |
| 2.2   | 2.2              | 220               | 2.86                       | 450                      | 360-430                     | 10.6                     | 0-599.00              |
| 4.0   | 4.0              | 220               | 4.81                       | 450                      | 360-430                     | 17                       | 0-599.00              |

## 2.4 Technical Specification

|                            |   |  |
|----------------------------|---|--|
| <b>Power input</b>         | Voltage                                   | 1T:90 - 400VDC;1PH/3PH 110VAC<br>2S/2T:150 - 450VDC;1PH/3PH 220 - 240VAC<br>4T:250 - 900VDC/350- 900VDC;3PH 380 - 480VAC   |
|                            | Frequency                                 | 50Hz/60Hz, tolerance ±5%   |
|                            | Voltage range                             | Voltage out-of-balance rate<3%   |
|                            | Total Voc range (V) of recommended panels | 1T Type:175 - 380VDC<br>2S/2T Type:360 - 430VDC<br>4T Type:620 - 750VDC  |
| <b>Power output</b>        | Adaptive motor type                       | Asynchronous motor, permanent magnet synchronous motor   |
|                            | Output voltage (V)                        | 0%~rated input voltage, error < ±3%  |
|                            | Output frequency (Hz)                     | 0.00%~599.00Hz; unit:0.01Hz  |
|                            | Overload capacity                         | 150% rated current/60s, 180% rated current/10s, 200% rated current/0.5s  |
| <b>Basic functions</b>     | ACC/DEC time                              | 0.0~650.00s  |
|                            | Switching frequency                       | 1.0kHz~16kHz   |
|                            | Frequency setting                         | Digital setting + control panel, Communication, Analog setting, Terminal pulse setting   |
|                            | Motor start-up methods                    | Started from starting frequency, DC brake start-up, Speed tracking start   |
|                            | Motor stop methods                        | Ramp to stop, Free stop  |
| <b>Protection function</b> | Solar pump protection function            | Dry run,low frequency,low power,dormancy,water full,pump over current protection   |
|                            | Basic protection function                 | Inverter unit protection, Overcurrent during acceleration, Overcurrent during deceleration, Over current at constant speed, Overvoltage during acceleration, Overvoltage during deceleration, Overvoltage at constant speed, Undervoltage, Power input phase loss, Power output phase loss,Inverter overload, Motor overload, Current detection fault, Inverter temperature exceeds the limit, Load becoming 0 , Too large speed deviation, Short circuit to ground, External equipment fault, Fast current limit fault, Communication fault, Master slave control communication disconnection, EEPROM read-write fault, PID feedback lost during running, Data storage fault, Control power supply fault, Motor switchover fault during running,Accumulative running time reached |

|                              |                     |   |
|------------------------------|---------------------|---|
| <b>Communication network</b> |                     | Supports 485/Modbus protocol, protibus-DP protocol, CANopen protocol, Profinet protocol, EtherCAT protocol, Modbus TCP protocol and CAN customized protocol.  |
| <b>Featured functions</b>    |                     | Parameter copy, parameter backup, common DC bus, various master & auxiliary setting and switchover, flying start, a variety of Accel/Decel curves optional, brake control, 15-step speed control programmable (2-step speed supports flexible frequency command), wobble frequency control, three history faults, over excitation brake, over voltage stall protection, under voltage stall protection, restart on power loss, skip frequency, frequency binding, four kinds of Accel/Decel time, motor thermal protection, flexible fan control, process PID control, simple PLC, multi-functional key programmable, autotuning, field-weakening control, high-precision torque restraint, V/f separated control |
| <b>Control Panel</b>         | Standard (Internal) | LED control panel   |
|                              | Optional (External) | Single-line display LED control panel、LCD control panel   |
| <b>Environment</b>           | Place of operation  | Indoors, no direct sunlight, free from dust, corrosive gases, flammable gases, oil mist, water vapor, water drop or salt, etc.  |
|                              | Altitude            | 0~2000m. De-rate 1% for every 100m when the altitude is above 1000 meters   |
|                              | Ambient temperature | -10°C~50°C, The rated output current should be derated 1% for every 1°C when the ambient is 40°C~50°C   |
|                              | Relative humidity   | 0~95%, no condensation  |
|                              | Vibration           | Less than 5.9m/s <sup>2</sup> (0.6g)  |
|                              | Storage temperature | -20°C~+60°C   |
| <b>Others</b>                | IP grade            | IP20  |
|                              | Cooling method      | Forced air cooling  |

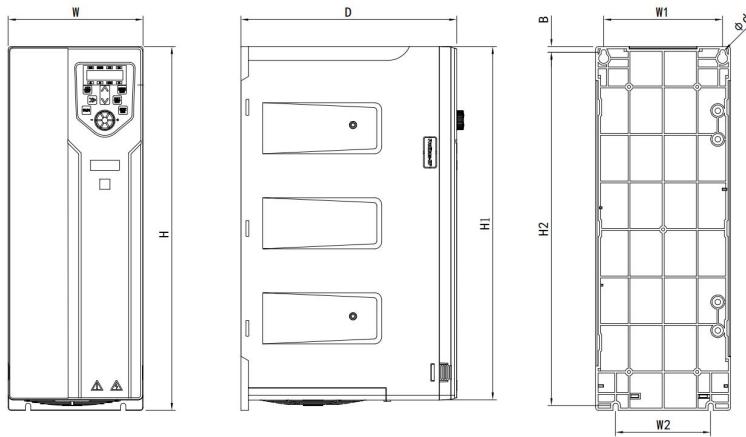

## 2.5 Appearance, Mounting Dimensions

Plastic housing

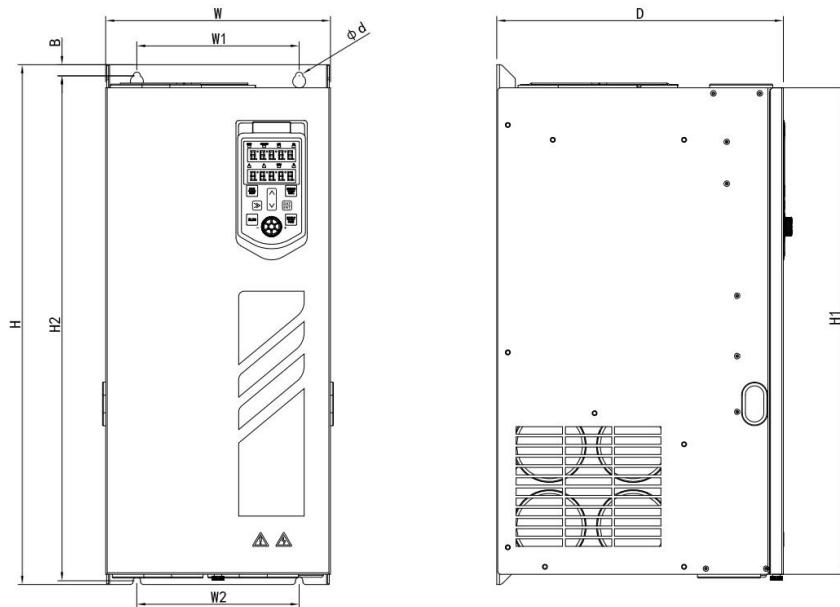

Fig. 2.5-1 Overall dimensions of PV300-1T(0.75kW~1.5kW)、PV300-2S/2T(0.75kW~2.2kW)

PV300-4T(0.75kW~4.0kW)

Plastic housing

Fig. 2.5-2 Overall dimensions of PV300-2S/2T(4.0kW)、PV300-4T(5.5kW~22kW)

Sheet metal housing

Fig. 2.5-3 Overall dimensions of PV300-4T(30kW~560kW)

# Chapter 3 Installation and Wiring

## 3.1 Installation Environment

- 1) Ambient temperature is in the range of -10°C ~ 40°C.
- 2) Inverter should be installed on surface of flame retardant object, with adequate surrounding space for heat dissipation.
- 3) Installation should be performed where vibration is less than 5.9m/s<sup>2</sup> (0.6g).
- 4) Protect from moisture and direct sunlight.
- 5) Protect the cooling fan by avoiding oil, dust and metal particles.
- 6) Do not expose to an atmosphere with flammable gases, corrosive gases, explosive gases or other harmful gases.
- 7) Prevent drilling residues, wire ends and screws falling into Inverter.
- 8) Ventilation part of the Inverter should be installed outside from harsh environment (e.g. textile facilities with fiber particles and chemical facilities filled with corrosive gases).

## 3.2 Minimum Mounting Clearances

To ensure favorable heat dissipation, mount the Inverter upright on a flat, vertical and level surface as per Fig. 3.2-1. For installation inside cabinet, the product shall be mounted side to side to the greatest extent while adequate surrounding space shall be preserved for favorable heat dissipation.

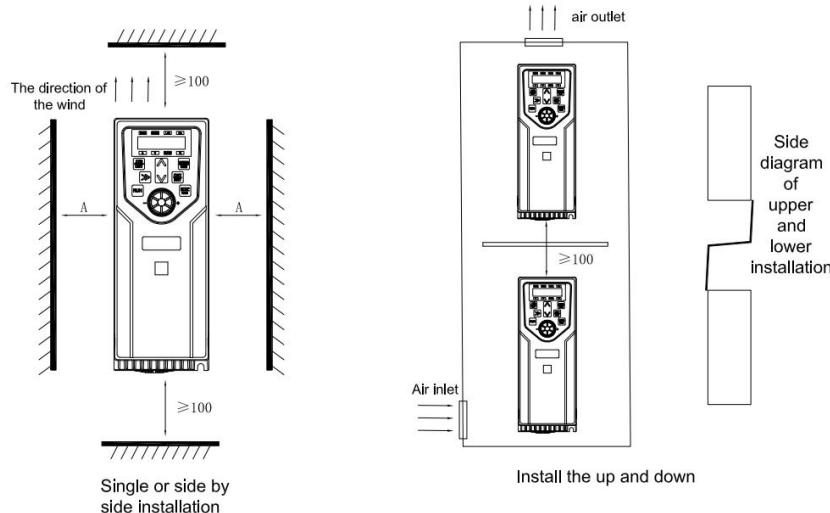

Fig. 3.2-1 Installation of frequency converter

Single installation:when the power of the converter is not greater than 22kW, the size of A can be ignored. When greater than 22kW, A should be greater than 45mm.

Upper and lower installation:When installing the Inverters up and down, please install the Air Guide Plate shown in the figure.

| Power level | Mounting dimensions for upper and lower installation | A     |
|-------------|--|-------|
| ≤22kW       | ≥100mm   | ≥8mm  |
| 30kW~37kW   | ≥200mm   | ≥45mm |
| ≥45kW       | ≥300mm   |       |

### 3.3 Remove & Mount Control Panel and Cover

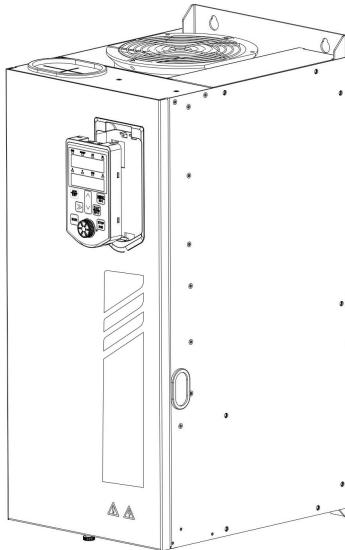

Fig. 3.3-1 Remove and Mount Control Panel

- **Remove control panel:**

Place your middle finger on the finger insertion hole above the control panel, gently press and hold the top shrapnel and pull outward.

- **Mount control panel:**

First the bottom of the control panel fixed buckle docking in the operation panel installation slot below the installation claw, with the middle finger press the top of the shrapnel pushed in, in place after the release of the middle finger can be.

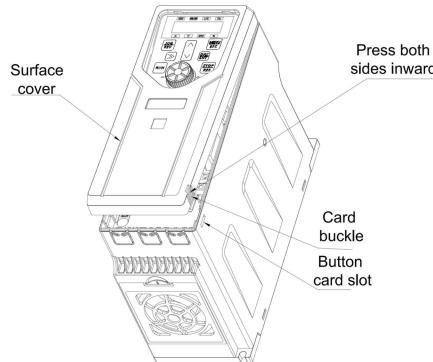

Fig. 3.3-2 Schematic diagram of removal and installation of plastic shell cover plate

- **Removal of plastic shell cover plate:**

Use a finger or a tool to hook the lower end of the cover plate to the inside.

- **Installation of plastic shell cover plate:**

First push the upper hook of the cover into the outer box, and then press the lower hook of the cover into the outer box.

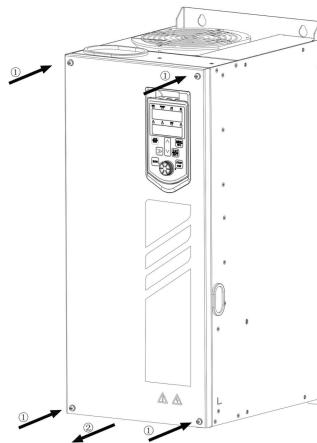

Fig. 3.3-3 Schematic diagram of disassembly and installation of sheet metal housing cover plate

Remove and install the sheet metal cover: Use a Phillips screwdriver to remove the four screws shown in ① and remove the cover in the direction shown in ②.

### 3.4 Wiring Diagram

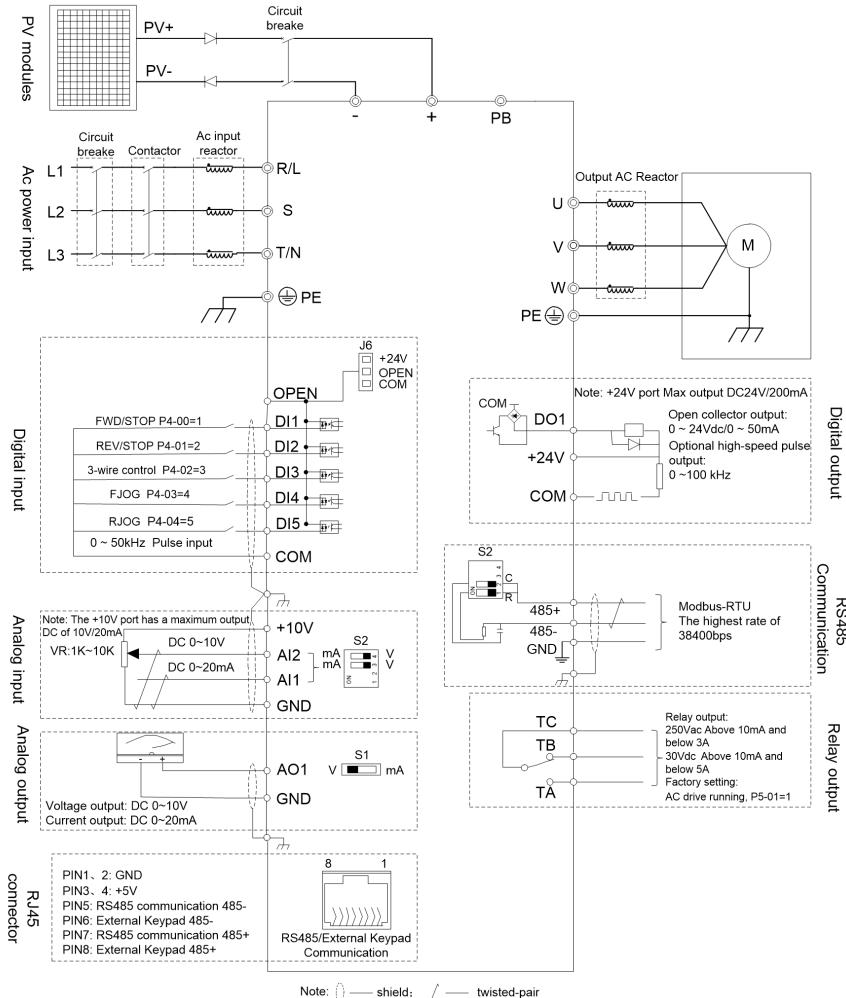

Fig. 3.4-1 Wiring diagram

#### Notice:

- ① Terminal Indicates the main loop terminal, indicates the control loop terminal;
- ② Signal cables and power cables must be routed separately, and the control cables and power cables should be crossed at a 90-degree Angle as far as possible. The analog signal line reference diagram describes the selection of linear, power cable is the best choice of shielded three core cable;
- ③ Single-phase 220V model power terminals are L and N;
- ④ "+" and "-" used to connect DC power supply. "+" terminals must connect positive of DC solar power and "-" must connect negative of DC solar power supply. Otherwise it will cause inverter

- damaged seriously;
- ⑤ This inverter can compatible with connecting DC power supply input and AC grid power supply input at the same time. But please connect a backward diode between PV modules and inverter which use to prevent current forward to solar panels and damaged solar panels;
  - ⑥ When connecting both AC grid and DC solar power together, the inverter drawing power as according to which side power voltage is higher.

### 3.5 Control Terminal Specification

#### 3.5.1 Schematic diagram of control board layout

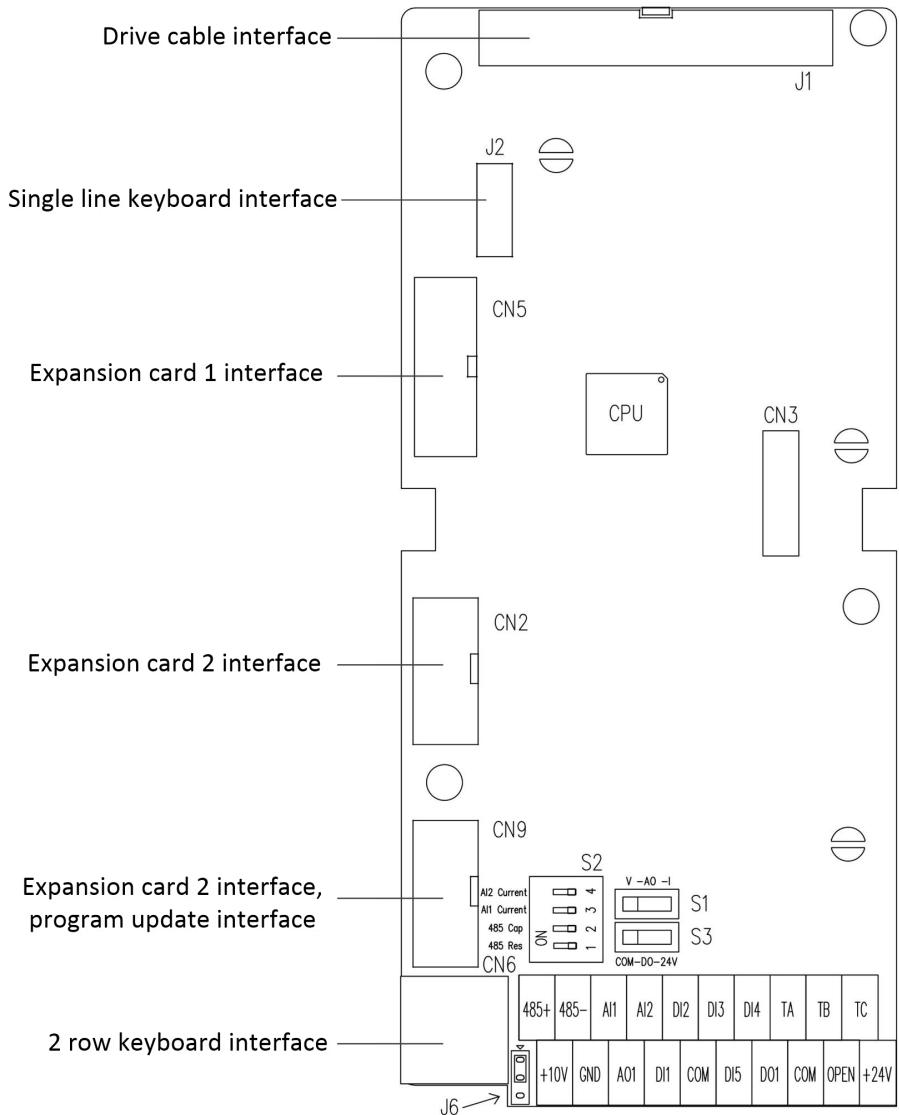

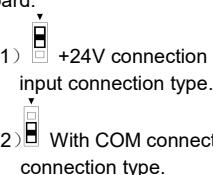

Fig. 3.5-1 Schematic diagram of control board layout

### 3.5.2 Function description of the control terminals

Table 3.5-1 Functions of control terminals

| Category     | Terminal | Terminal Name                  | Function Description   |
|--------------|----------|--------------------------------|--|
| Power source | +10V     | Analog input reference voltage | 1、Provide +10 V power supply to external unit.<br>2、it provides power supply to external potentiometer with resistance range of 1kΩ~10kΩ.<br>3、Maximum output current:20mA.  |
|              | GND      | Analog ground                  | Isolated from COM interiorly   |
|              | +24V     | External +24 V power supply    | 1、Provide +24 V power supply to external unit. Generally, it provides power supply to DI/DO terminals and external sensors.<br>2、Maximum output current:200 mA   |
|              | COM      | +24V ground                    | Isolated from GND interiorly   |
|              | OPEN     | External power input terminal  | Connect to +24V or COM via the J6 pin (DI) on the control board:<br><br>1) +24V connection (default), external support for NPN input connection type.<br>2) With COM connection, external support for PNP input connection type.  |
| Analog input | AI1      | Analog input 1                 | <p>1、Input range:DC 0V~10V or 0/4mA~20mA, through the S2 switch on the control panel to select the third gear (AI1) :</p>  <ul style="list-style-type: none"> <li>1)  Indicates DC 0V to 10V signals (default).</li> <li>2)  Indicates a signal from 0/4 mA to 20mA.</li> </ul> <p>2、Input impedance:22 kΩ (voltage input),500 Ω (current input).</p>    |
|              | AI2      | Analog input 2                 | <p>1、Input range:DC 0V~10V or 0/4mA~20mA, through the S2 switch on the control panel to select the fourth gear (AI2):</p>  <ul style="list-style-type: none"> <li>1)  Indicates DC 0V to 10V signals (default).</li> <li>2)  Indicates a signal from 0/4 mA to 20mA.</li> </ul> <p>2、Input impedance:22 kΩ (voltage input), 500Ω (current input).</p> |
|              | GND      | Analog ground                  | Isolated from COM interiorly   |

| Category       | Terminal | Terminal Name                                     | Function Description   |
|----------------|----------|---|--|
| Digital input  | DI1      | Digital input<br>Terminals 1~4                    | 1、Optical coupling isolation, compatible with bipolar input, internal impedance $3.6\text{ k}\Omega$ .   |
|                | DI2      |   | 2、Multi-function digital input, through P4-00 to P4-04 to set the function.  |
|                | DI3      |   | 3、Driver default for the internal supply of +24V power, COM for the common end.  |
|                | DI4      |   | 4、When the external power supply is used, the cable connection mode see Figure 3.5-4 and 3.5-5. The voltage range of the external power supply is $+24V\pm10\%$ .  |

| Category                    | Terminal | Terminal Name                      | Function Description   |
|-----------------------------|----------|------------------------------------|--|
| 485 Communication interface | 485+     | 485 differential signal +          | Use a twisted-pair shielded cable for the standard RS-485 communication terminal.  |
|                             | 485-     | 485 differential signal -          |  |
|                             | GND      | 485 communication shield grounding |  |
| Dial switches               | 485-R    | OFF the port                       | When dialed to this port, the 485 communication 120 Ω terminal resistance is disconnected.   |
|                             |          | ON the port                        | When dialed to the port 485 communication 120 Ω terminal resistance is connected.  |
|                             | 485-C    | OFF the port                       | When the terminal is dialed, the 485 communication filter capacitor is disconnected.   |
|                             |          | ON the port                        | When dialed to the port, 485 communication filter capacitor is connected.  |
|                             | AI1      | V the port                         | When the AI1 terminal is switched to this terminal, select the input DC 0 to 10V voltage signal.   |
|                             |          | mA the port                        | When the terminal is switched to this terminal, select the input DC 0/4 mA to 20mA current signal for the AI1 terminal.  |
|                             | AI2      | V the port                         | When the AI2 terminal is switched to this terminal, select the input DC 0 to 10V voltage signal.   |
|                             |          | mA the port                        | When the terminal is switched to this terminal, select the input DC 0/4 mA to 20mA current signal for the AI2 terminal.  |
|                             | AO       | V the port                         | When the terminal is switched to this terminal, the AO1 terminal outputs DC 0 to 10V voltage signals.  |
|                             |          | mA the port                        | When the terminal is switched to this port, the AO1 terminal outputs DC 0/4 mA to 20mA current signals.  |
|                             | DI       | 24V the port                       | When the OPEN terminal is connected to 24V, the DI and COM short input are valid. Can also use the NPN input type.   |
|                             |          | COM the port                       | When you dial this end, the OPEN terminal is connected to COM. In this case, the DI and 24V short input are valid. PNP input type is also supported.   |
|                             | DO       | COM the port                       | When dialed to this end, the DO output is selected as the internal power NPN connection type output.   |
|                             |          | 24V the port                       | When dialed to this end, DO output is selected internal power PNP connection type output.  |
| Shielding earthing          | GND      | Shielded cable grounding           | <p>1、It is used for shielding and grounding of control cables. When the field interference is large or the control line is long, it must be well grounded to reduce the electromagnetic interference to comply with EMC specifications.</p> <p>2、Do not connect this terminal to the PE cable of the power supply.</p> |

### 3.5.3 Cable Connections to Main control board terminals

#### 3.5.3.1 Digital input terminal

Multifunctional digital input terminals support NPN or PNP connection type. DI1 to DI5 terminals are flexibly connected to external devices. You can select the NPN or PNP mode through the jump cap at J6 on the control board (the factory default mode is NPN). Figure 3.5-2 to 3.5-2 shows the jumping caps and cabling modes of the multi-function digital input terminals in different modes.

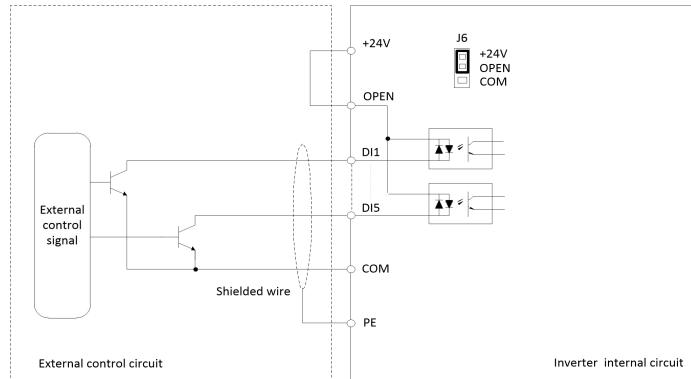

Fig. 3.5-2 NPN mode Uses the internal power supply

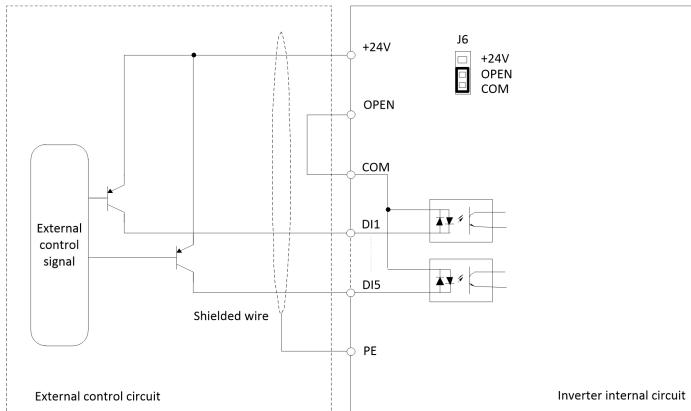

Fig. 3.5-3 PNP mode uses an internal power supply

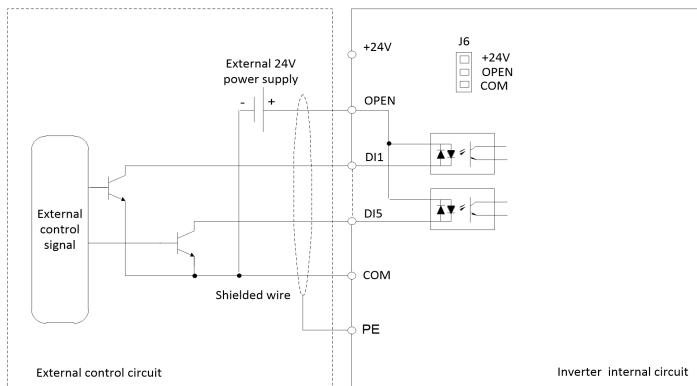

Fig. 3.5-4 NPN mode Uses external power supplies

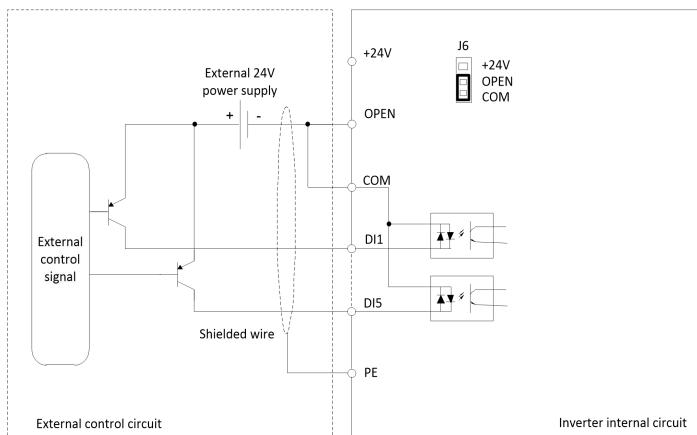

Fig. 3.5-5 PNP mode uses an external power supply

#### Precautions:

If the external power supply is connected in NPN mode, remove the jump cap in position J6.

#### 3.5.3.2 Analog input terminal

Because weak analog voltage signal is particularly vulnerable to external interference, it is generally necessary to use shielded twisted-pair cable, and the wiring distance is as short as possible, not more than 20m, according to different analog signal input types can be adjusted by adjusting the S2 dip switch inside the Inverter third (AI1) and fourth (AI2) to select the corresponding input signal type. Figure 3.5-6 and 3.5-7 show dip switches and cabling methods. When some analog signals are seriously interfered, filter capacitors or ferrite magnetic rings need to be added to the source side of the analog signal, as shown in Fig. 3.5-8.

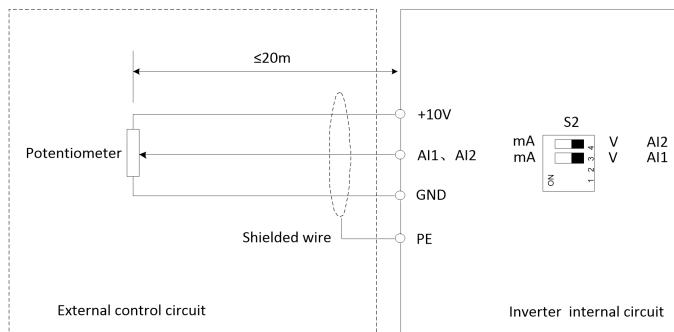

Fig. 3.5-6 Analog input terminal input voltage signal wiring diagram

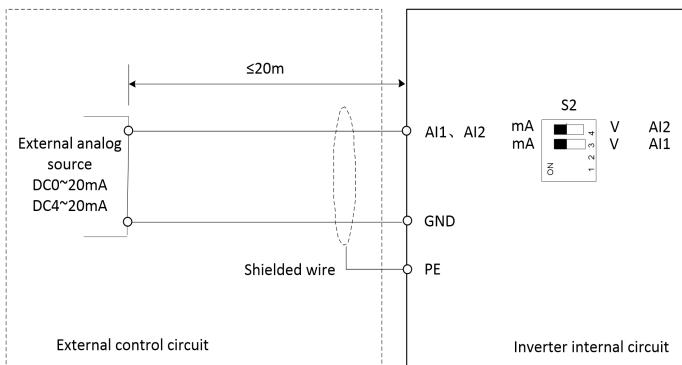

Fig. 3.5-7 Analog input terminal Input current signal wiring diagram

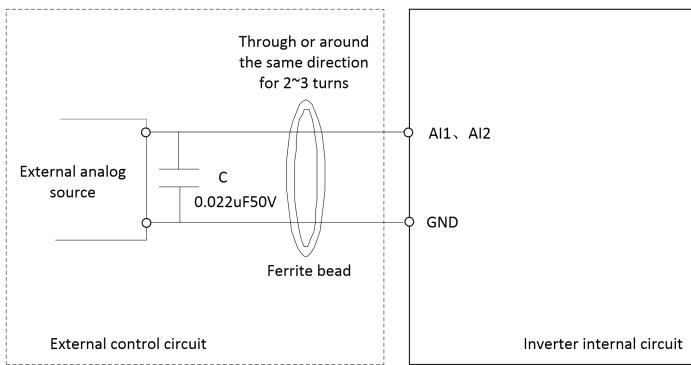

Fig. 3.5-8 Analog input terminal cable coat ferrite magnetic ring wiring diagram

### 3.5.3.3 Digital Output terminal

When the digital output terminal DO1 needs to drive the relay, the absorption diode should be installed on both sides of the relay coil, otherwise it may cause damage to DC +24V power supply,

and the driving capacity of DO1 is not greater than 50mA. The DO1 output can choose the wiring mode of NPN and PNP by adjusting the dip switch S3. Figure 3.5-9 and 3.5-10 show dip switches and cable distribution modes.

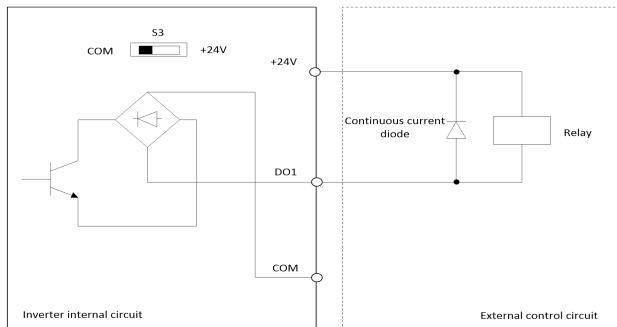

Fig. 3.5-9 Digital output terminal using the driver internal power NPN mode wiring diagram

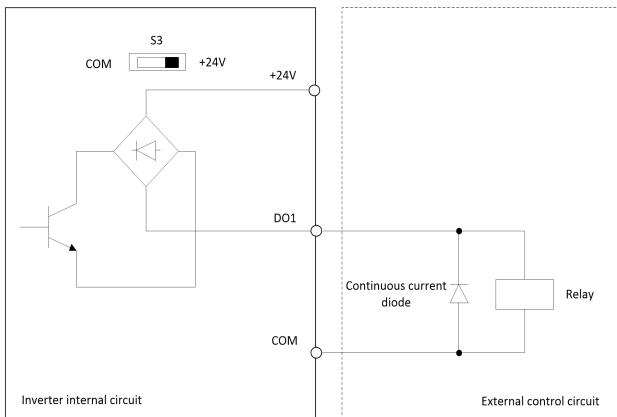

Fig. 3.5-10 Digital output terminal using the driver internal power PNP mode wiring diagram

### 3.5.3.4 Analog output terminal

The analog output terminal AO1 external analog quantity can represent a variety of physical quantities. You can select the output current ( $0/4 \sim 20mA$ ) or ( $0 \sim 10V$ ) through DIP S1. Figure 3.5-11 and 3.5-12 show dip switches and terminal wiring methods.

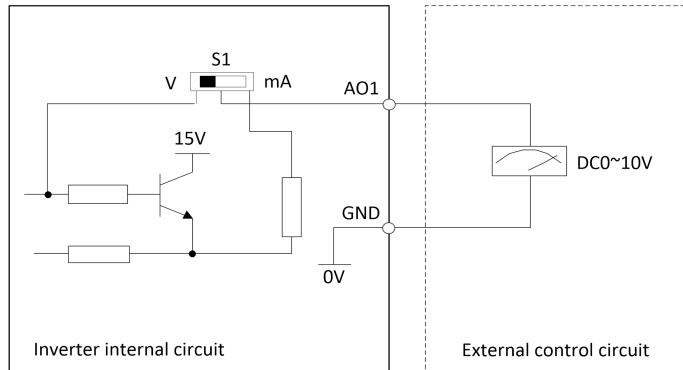

Fig. 3.5-11 Analog output terminal output voltage signal wiring diagram

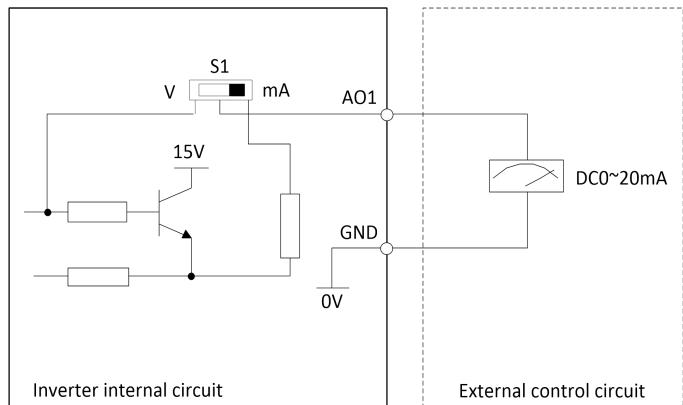

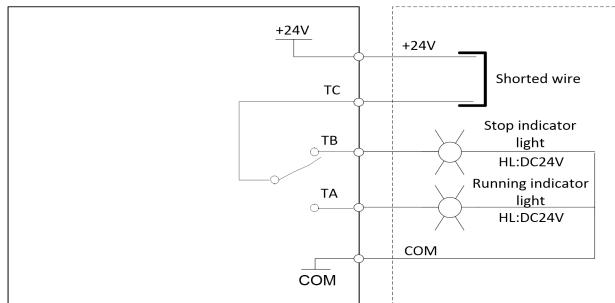

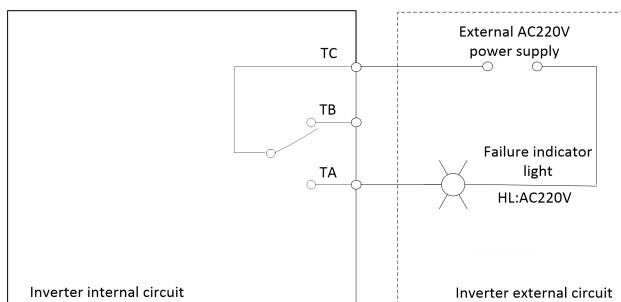

Fig. 3.5-12 Analog output terminal output current signal wiring diagram

### 3.5.3.5 Relay Output terminal

The wiring of relay output terminals is shown in Fig. 3.5-13, where TC is the common end of relay contacts, TB is the normally closed terminal, TA is the normally open terminal, and the driving load of relay does not exceed AC 250V3A and DC 30V 5A.

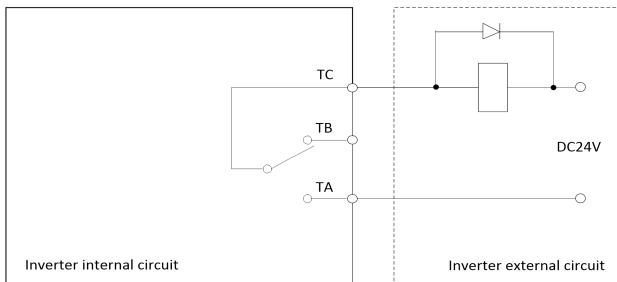

Use internal DC24V power supply

Use external AC220V power supply

Fig. 3.5-13 Wiring diagram of relay output terminal

When the relay output is connected to the inductive load (such as relay, contactor or motor), voltage peak will be caused when the current is cut off. Therefore, it is better to add varistor to the relay contact for protection, and install absorbent circuit, such as varistor, RC absorbent circuit or diode, on the inductive load to ensure the minimum interference during shutdown. For details, see Fig. 3.5-14:

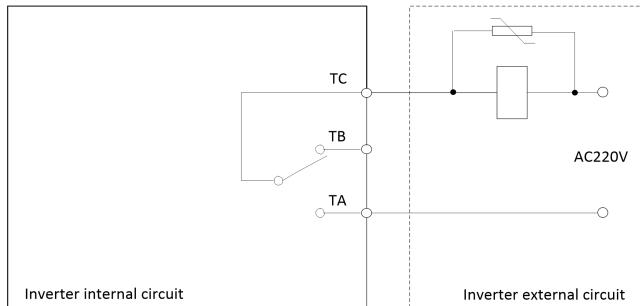

Fig. 3.5-14 Relay output terminal anti-interference processing

### 3.5.3.6 RS485 Communication Terminal

Communication terminals 485+ and 485- are the RS485 communication interfaces of the Driver. 485+ is connected to the positive end of the communication of the host computer, and 485- is connected to the negative end of the host computer, realizing the networking control between the host computer (PC or PLC controller) and the Driver. The connection between RS485 and the Driver is shown in Fig. 3.5-15 below:

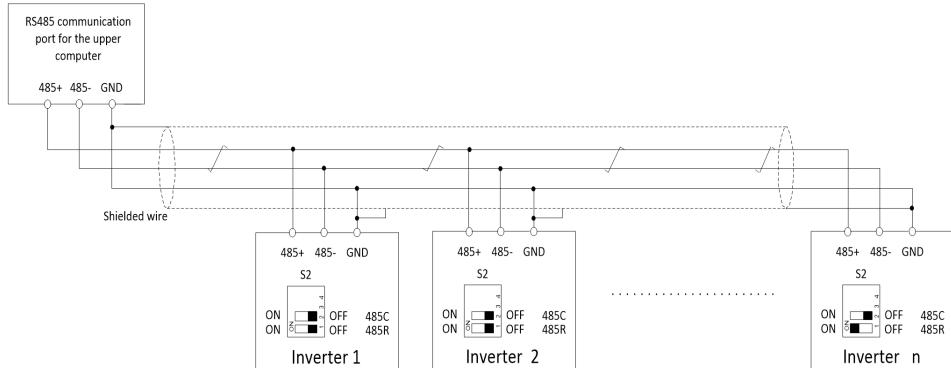

Fig. 3.5-15 RS485 communication terminal wiring diagram of one or multiple drive

#### Precautions:

RS485 communication should use twisted-pair shielded wires as far as possible, and short-connect all communication GND. In multi-machine communication, switch the first gear of dip switch of the most terminal drive S2 to ON (connect the terminal resistor).

# Chapter 4 Operation and Run Instructions

## 4.1 Operation of Control Panel

As a human-machine interface, control panel is the main part for the drive to receive command and display parameters.

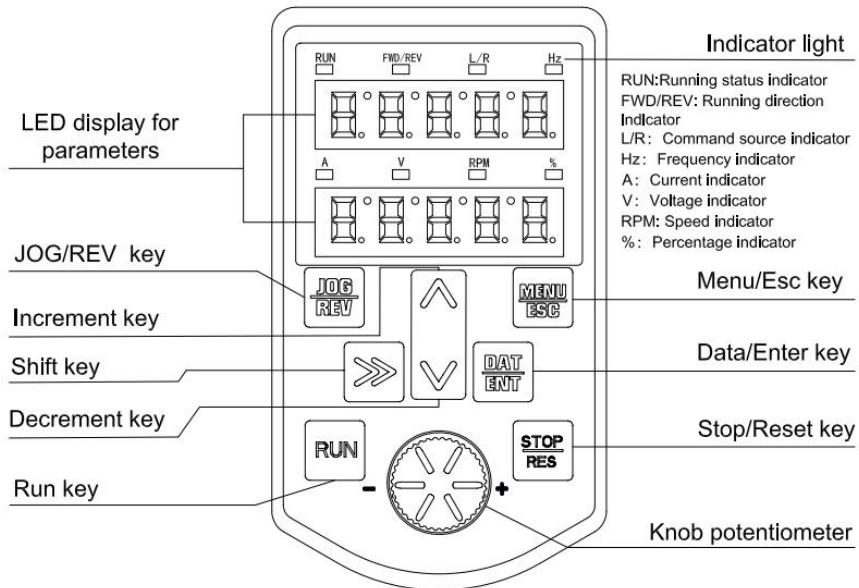

Fig.4.1-1 Control panel

### 4.1.1 Key Functions on Control Panel

| Symbol | Key name  | Meaning   |
|--------|-----------|---|
|        | JOG/REV   | P7-00 setting 2 is for JOG RUN, P7-00 setting 1 is for Reverse RUN.   |
|        | MENU/ESC  | 1) Enter or exit Level 1 menu.<br>2) Return to the previous menu.   |
|        | Increment | 1) When navigating a menu, it moves the selection up through the screens available.<br>2) When editing a parameter value, it increases the displayed value.<br>3) When the Inverter is in RUN mode, it increases the speed. |

| Symbol | Key name      | Meaning   |
|--------|---------------|---|
|        | Decrement     | 1) When navigating a menu, it moves the selection down through the screens available.<br>2) When editing a parameter value, it decreases the displayed value.<br>3) When the Inverter is in RUNNING mode, it decreases the speed. |
|        | Shift         | 1) Select the displayed parameter in the STOP or RUNNING status.<br>2) Select the digit to be modified when modifying a parameter value.  |
|        | DAT/ENT       | 1) Enter each level of menu interface.<br>2) Confirm displayed parameter setting.   |
|        | Potentiometer | Clockwise rotation increases the operation value, and counterclockwise rotation decreases the operation value.  |
|        | RUN           | Start the Inverter when using the operating panel control mode.<br>It is inactive when using the terminal or communication control mode.  |
|        | STOP/RES      | 1) Stop the Inverter when the drive is in the RUNNING status.<br>2) Perform a reset operation when the drive is in the FAULT status.  |

#### 4.1.2 Status Indicators

| Status Indicators | Indication   |
|-------------------|--|
| RUN               | ON indicates the RUNNING status.<br>OFF indicates the STOP status.   |
| FWD/REV           | ON indicates forward motor rotation.<br>OFF indicates reverse motor rotation.  |
| L/R               | ON indicates under terminal control<br>OFF indicates under operating panel control.<br>FLASHING indicates under serial communication control |
| Hz                | Hz for frequency   |
| A                 | A for current  |
| V                 | V for voltage  |
| RPM               | RPM for motor speed  |
| %                 | Percentage   |

# Chapter 5 List of Parameters

The symbols in the function code table are described as follows:

"☆":The parameter can be modified when the Inverter is in either stop or running state

"★":The parameter cannot be modified when the Inverter is in the running state

"○":The parameter is the actually measured value and cannot be modified

"●":The parameter is factory parameter and can be set only by the manufacturer

## 5.1 Fundamental group of parameters

| Function Code                             | Parameter Name                                 | Setting Range   | Default | Property |

### 5.3 DO terminal function selection

| DO Setting Value | Function   | DO Setting Value | Function                           |
|------------------|--|------------------|------------------------------------|
| 0                | No output.   | 19               | Light load output                  |
| 1                | Inverter running   | 20               | Load pre-alarm output 1            |
| 2                | Inverter forward running                                 | 21               | Load pre-alarm output 2            |
| 3                | Inverter reverse running                                 | 22               | PID feedback sensor wire broken    |
| 4                | Fault trip alert 1 (alert during fault self-recovery)    | 23               | PID feedback upper limit reached   |
| 5                | Fault trip alert 2 (no alert during fault self-recovery) | 24               | PID feedback lower limit unreached |
| 6                | External fault stop(All external fault outputs)          | 25               | PLC cycle period completed         |
| 7                | Inverter undervoltage                                    | 26               | PLC run phase completed            |
| 8                | Inverter running preparation completed                   | 27               | RS485 Communication given          |
| 9                | Set frequency reached                                    | 28               | Timer's set time reached           |
| 10               | Frequency reached 1                                      | 29               | Counter's setting value reached    |
| 11               | Frequency reached 2                                      | 30               | Counter's maximum reached          |
| 12               | Output frequency detection test 1 (FDT1)                 | 31               | Dynamic braking                    |
| 13               | Output frequency detection test 2 (FDT2)                 | 32               | Emergency stopping                 |

|    |                               |    |                               |
|----|-------------------------------|----|-------------------------------|
| 14 | Zero-speed running            | 33 | PG card feedback disconnected |
| 15 | Upper frequency limit reached | 34 | Brake control output          |
| 16 | Lower frequency limit reached | 35 | Module temperature reached    |
| 17 | Current reached 1             | 36 | Motor temperature reached     |
| 18 | Current reached 2             | 37 | Warning output                |

## 5.4 AO & HDO terminal function selection

| Terminal Setting Value | Function                | Terminal Setting Value | Function   |
|------------------------|-------------------------|------------------------|--|
| 0                      | Output frequency        | 9                      | Given torque   |
| 1                      | Given frequency         | 10                     | Mechanical speed   |
| 2                      | Output current          | 11                     | PID given value  |
| 3                      | Output power            | 12                     | PID feedback value   |
| 4                      | Output voltage          | 13                     | Pulses input value DI5   |
| 5                      | AI1 input value         | 14                     | Bus voltage  |
| 6                      | AI2 input value         | 15                     | Input voltage (0~10V corresponds to 0~1.5 times the nominal voltage) |
| 7                      | 485 communication given | 16                     | Inverter temperature (0~10V corresponds to 0~100.0°C)                |
| 8                      | Output torque           | 17                     | Motor temperature (0~10V corresponds to 0~200.0°C)                   |

## 5.5 Fault Code Table

| Keyboard display | Communication code | Fault type                                | Keyboard display | Communication code | Fault type                                 |
|------------------|--------------------|---|------------------|--------------------|--|

## Chapter 6 Trouble Shooting

If a fault occurs during the system operation, the Inverter will immediately protect the motor to stop the output, and the corresponding Inverter fault relay contact will act. The Inverter panel displays the fault code. The fault type and common solution corresponding to the fault code are shown in the following table. The list in the table is for reference only, please do not repair or modify it without authorization. If the fault cannot be eliminated, please seek technical support from our company or the product agent.

### 6.1 Faults and Solutions

| Communication code | Display | Fault Name                 | Possible Causes  | Solutions  |
|--------------------|---------|----------------------------|--|--|
| 1                  | E.SC    | VCE Overcurrent protection | 1:Whether the motor connection terminals U, V, W have short-circuit or straight-through between phases or to ground<br>2:Whether the module is overheating<br>3:Whether the internal wiring of the Inverter is loose<br>4:Whether the main control board, driver board or module is normal   | 1:Check motor wiring and output impedance to ground<br>2:Check whether the fan and air duct are normal<br>3:Connect all loose wires<br>4:Seek technical support  |
| 2                  | E.OC1   | Acceleration overcurrent   | 1:The output circuit is grounded or short circuited<br>2:Motor parameter is not right<br>3:The acceleration time is too short<br>4:Manual torque boost or V/F curve is not appropriate<br>5:The voltage is too low<br>6:The startup operation is performed on the rotating motor<br>7:A sudden load is added during acceleration<br>8:The Inverter model is of too small | 1:Eliminate external faults<br>2:Perform the motor auto-tuning<br>3:Increase the acceleration time<br>4:Correctly set the V/f curve<br>5:Check grid input power<br>6:Select rotational speed tracking restart or start the motor after it stops<br>7:Remove the added load<br>8:Select an Inverter of higher power class |
| 3                  | E.OC2   | Deceleration overcurrent   | 1:The output circuit is grounded or short circuited<br>2:Motor parameter is not right<br>3:The deceleration time is too short<br>4:The voltage is too low<br>5:A sudden load is added during deceleration<br>6:The inertia of the load is too large<br>7:The magnetic flux braking gain is too large   | 1:Eliminate external faults<br>2:Perform the motor auto-tuning<br>3:Increase the deceleration time<br>4:Adjust the voltage to normal range<br>5:Remove the added load<br>6:Install the braking unit and braking resistor<br>7:decrease the over-excitation gain  |

|    |       |                             |   |  |
|----|-------|-----------------------------|---|--|
| 4  | E.OC3 | Constant speed overcurrent  | 1:The output circuit is grounded or short circuited<br>2:Motor parameter is not right.<br>3:The voltage is too low<br>4:A sudden load is added during operation<br>5:The Inverter model is of too small   | 1:Eliminate external faults<br>2:Perform the motor auto-tuning<br>3:Adjust the voltage to normal range<br>4:Remove the added load<br>5:Select an Inverter of higher power class                                    |
| 8  | E.oU2 | Acceleration over voltage   | 1:The input voltage is too high<br>2:An external force drives the motor during acceleration<br>3:The acceleration time is too short<br>4:The inertia of the load is too large<br>5:Motor parameter is not right                                   | 1:Adjust the voltage to normal range<br>2:Cancel the external force or install a braking resistor<br>3:Extend the acceleration time<br>4:Use energy consumption braking<br>5:Auto-tune the parameters of the motor |
| 9  | E.oU3 | Deceleration Over voltage   | 1:The input voltage is too high<br>2:An external force drives the motor during deceleration<br>3:The deceleration time is too short.<br>4:The inertia of the load is too large  | 1:Adjust the voltage to normal range<br>2:Cancel the external force or install a braking resistor<br>3:Increase the deceleration time<br>4:Install the braking unit and braking resistor                           |
| 10 | E.oU4 | Constant speed over voltage | 1:The input voltage is too high<br>2:An external force drives the motor during acceleration<br>3:When the vector control is running, the parameters of the regulator are not set properly<br>4:The load fluctuates too much                       | 1:Adjust the voltage to normal range<br>2:Cancel the external force or install a braking resistor<br>3:Correctly set the regulator parameters<br>4:Check the load  |
| 11 | E.LU2 | Undervoltage fault          | 1:Instantaneous power failure occurs<br>2:The input voltage exceeds the allowed range<br>3:The DC bus voltage is too low<br>4:The rectifier bridge and buffer resistor are faulty<br>5:The drive board is faulty<br>6:The control board is faulty | 1:Reset the fault<br>2:Adjust the input voltage to within the allowed range<br>3:Seek for maintenance  |
| 12 | E.ILF | Input phase loss            | 1:The three-phase power input is abnormal<br>2:The drive board is faulty<br>3:The lightening board is faulty<br>4:The main control board is faulty  | 1:Eliminate external faults<br>2:Seek for maintenance  |

|    |       |                         |   |   |
|----|-------|-------------------------|---|---|
| 13 | E.oLF | Output phase loss       | 1:The cable connecting the Inverter and the motor is faulty<br>2:The Inverter's three-phase outputs are unbalanced when the motor is running<br>3:The drive board is faulty<br>4:The module is faulty   | 1:Eliminate external faults<br>2:Check the motor or replace the motor<br>3:Seek for maintenance   |
| 14 | E.oL1 | Inverter overload       | 1:The torque boost value is too large during V/f control<br>2:The starting frequency is too high<br>3:The acceleration and deceleration time is too short<br>4:Improper setting of motor parameters<br>5:Overload<br>6:The V/f curve is not suitable for V/f control<br>7:Restart the rotating motor<br>8:Output phase-to-phase short-circuit or short-circuit to ground  | 1:Reduce the torque boost value<br>2:Reduce the starting frequency value<br>3:Extend the acceleration and deceleration time<br>4:Correctly set according to the motor nameplate<br>5:Lighten the load<br>6:Correctly set the V/f curve<br>7:Reduce the current limit value or start by speed search<br>8:Check the motor wiring and output impedance to ground                              |
| 15 | E.oL2 | Motor overload          | 1:Whether the setting of motor protection parameter P9-00 is appropriate<br>2:Whether the load is too large or the motor is blocked<br>3:Inverter selection is too small<br>4:The torque boost value is too large during V/f control<br>5:The V/f curve is not suitable for V/f control<br>6:Improper setting of motor parameters<br>7:Improper setting of motor overload protection time<br>8:Motor stall or load sudden change is too large | 1:Set this parameter correctly<br>2:Reduce the load and check the motor and mechanical condition<br>3:Choose Inverters with larger power level<br>4:reduce the torque to increase the value<br>5:Set V/F curve correctly<br>6:Set correctly according to the motor nameplate<br>7:Set the motor overload protection time correctly<br>8:Check the cause of motor blocking or check the load |
| 16 | E.HAL | Current detection fault | 1:The internal connections become loose<br>2:Confirm whether the current detection device is normal<br>3:The control or drive board is faulty   | 1:Connect all cables properly.<br>2:Seek for maintenance  |

|    |       |                                       |   |  |
|----|-------|---------------------------------------|---|--|
| 17 | E.oH1 | Inverter over temperature             | 1:The ambient temperature is too high<br>2:The air filter is blocked<br>3:The cooling fan is damaged<br>4:The thermally sensitive resistor of the module is damaged<br>5:The inverter module is damaged.<br>6:The temperature sensor is improperly connected  | 1:Lower the ambient temperature<br>2:Clean the air filter<br>3:Replace the damaged fan<br>4:Replace the damaged thermally sensitive resistor<br>5:Replace the inverter module<br>6:Seek service        |
| 19 | E.dEv | Speed deviation over limit            | 1:The load is too heavy and the acceleration time is too short<br>2:P9-28 and P9-29 are set incorrectly<br>3:The set value of the deviation between the motor speed and the set speed is too small<br>4:The load fluctuates too much<br>5:The control parameter setting of vector control is unreasonable | 1:Increase the acceleration and deceleration time<br>2:Set P9-28 and P9-29 correctly based on the actual situation<br>3:Correctly set the speed deviation point<br>4:Stable load<br>5:Correct settings |
| 20 | E.GNd | Short circuit to ground               | 1:The motor is short circuited to the ground<br>2:The output wiring is short-circuited to ground<br>3:Abnormal motor insulation<br>4:The inverter module is abnormal<br>5:The output leakage current to the ground is too large   | 1:Replace the cable or motor<br>2:Check the motor wiring and output impedance to ground<br>3:Check the motor<br>4:Seek service   |
| 21 | E.EF1 | External fault                        | External fault normally closed or normally open signal is input via DI  | Reset the fault  |
| 23 | E.CE1 | Communication fault                   | 1:The host computer is in abnormal state<br>2:The communication cable is faulty<br>3:The communication parameters in group Fd are set improperly  | 1:Check cabling of the host computer<br>2:Check the communication cabling<br>3:Check Fd group parameters   |
| 25 | E.EEP | EEPROM parameters communication fault | The EEPROM chip is damaged  | Replace the main control board   |

|    |       |                                  |   |   |
|----|-------|----------------------------------|---|---|
| 26 | E.PId | PID feedback lost during running | 1:The PID feedback is lower than the setting of PA-08<br>2:The PID feedback channel is abnormal<br>3:PID parameter setting is unreasonable    | 1:Check the PID feedback signal or set PA-08 to a proper value<br>2:Check the feedback channel<br>3:Correct settings  |
| 32 | E.AT1 | Motor auto-tuning fault          | 1:Motor parameters are not set according to the nameplate<br>2:Parameter identification process timeout<br>3:Encoder abnormality              | 1:According to the motor nameplate parameter setting<br>2:Check the Inverter and motor wiring<br>3:Check whether the encoder parameter setting is correct or not. |
| 33 | E.SPd | Motor overspeed                  | 1:Is the encoder parameter setting correct<br>2:Is the parameter identification<br>3:Fault detection parameters P9-31, P9-32 set unreasonable | 1:Correctly set the encoder parameters<br>2:Motor parameter identification<br>3:Reasonable setting of fault detection parameters                                  |
| 36 | E.PG  | Encoder Failure                  | 1:Mismatch of encoder model<br>2:Encoder connection error<br>3:PG card or encoder abnormality   | 1:Correctly set the encoder type according to the actual<br>2:Test PG card power supply and phase sequence<br>3:Replace the PG card or encoder                    |
| 38 | E.oH2 | Motor Over Temperature Failure   | Motor temperatureU0-42 >P9-32 set value   | Reset the fault   |
| 46 | E.EF2 | External fault 2                 | The user-defined fault 1 signal is input via DI   | Reset the fault   |
| 47 | E.EF3 | External fault 3                 | The user-defined fault 2 signal is input via DI   | Reset the fault   |

## 6.2 Common Symptoms and Diagnostics

The following fault conditions may be encountered during the use of the Inverter, please refer to the following methods for simple fault analysis.

| NO. | Fault Name  | Possible Causes   | Solutions  |
|-----|---|---|--|
| 1   | There is no display at power-on.                              | 1:There is no power supply or the power supply is too low<br>2:The switching power supply on the Inverter board is faulty<br>3:The rectifier bridge is damaged<br>4:The buffer resistor of the Inverter is damaged<br>5:The control board or the keypad is faulty<br>6:The cable between the control board and the drive board or keypad breaks | 1:Check the power supply<br>2:Check the bus voltage<br>3:Re-connect the keypad and core cables<br>4:Seek service   |
| 2   | "E.GNd" is displayed at power-on                              | 1:The motor or the motor output cable is short-circuited to the ground<br>2:The Inverter is damage  | 1:Measure the insulation of the motor and the output cable with a megger.<br>2:Seek service  |
| 3   | Inverter over temperature                                     | 1:The setting of carrier frequency is too high<br>2:The cooling fan is damaged, or the air filter is blocked<br>3:Components inside the Inverter are damaged (thermal coupler or others)  | 1:Reduce the carrier frequency<br>2:Replace the fan and clean the air filter<br>3:Seek service   |
| 4   | The motor does not rotate after the Inverter runs.            | 1:Check the motor and the motor cables<br>2:The Inverter parameters are set improperly (motor parameters)<br>3:The cable between the drive board and the control board is in poor contact<br>4:The drive board is faulty  | 1:Ensure the cable between the Inverter and the motor is normal<br>2:Replace the motor or clear mechanical faults<br>3:Check and re-set motor parameters   |
| 5   | The DI terminals are disabled.                                | 1:The parameters are set incorrectly<br>2:The external signal is incorrect<br>3:The DI DIP switch is in the wrong position<br>4:The control board is faulty   | 1:Check and reset the parameters in group P4<br>2:Re-connect the external signal cables<br>3:Re-confirm whether the position of the DI DIP switch is consistent with the wiring method<br>4:Seek service |
| 6   | The Inverter reports over-current and over-voltage frequently | 1:The motor parameters are set improperly<br>2:The acceleration/deceleration time is improper<br>3:The load fluctuates  | 1:Re-set motor parameters or re-perform the motor auto-tuning<br>2:Set proper acceleration/deceleration time<br>3:Seek service   |

## Chapter 7 Maintenance

Affected by the ambient temperature, humidity, dust, vibration and the aging of the internal components of the Inverter, some potential problems may occur during the operation of the Inverter. The frequency converter conducts daily inspections and periodic inspections. Depending on the external environment of the Inverter, regular maintenance must be carried out every 3 to 6 months, so as to discover and deal with the problems that are difficult to find in the routine inspection process in time.

### 7.1 Daily inspection

To avoid damage to the Inverter and shorten its service life, please check the following items daily.

| Inspection items         | Check the content  | Measures  |
|--------------------------|--|---|
| Motor                    | <ul style="list-style-type: none"> <li>● Whether the motor has abnormal vibration and abnormal sound</li> </ul>  | <ul style="list-style-type: none"> <li>● Confirm whether the mechanical connection is abnormal</li> <li>● Confirm whether the motor is out of phase</li> <li>● Confirm that the motor fixing screws are secure</li> </ul>   |
| Fan                      | <ul style="list-style-type: none"> <li>● Abnormal use of Inverter and motor cooling fan</li> </ul>   | <ul style="list-style-type: none"> <li>● Confirm whether the cooling fan of the Inverter is running</li> <li>● Confirm whether the cooling fan on the motor side is abnormal</li> <li>● Confirm whether the ventilation channel is blocked</li> <li>● Check that the ambient temperature is within the allowable range</li> </ul> |
| Installation Environment | <ul style="list-style-type: none"> <li>● Whether the electrical cabinet and cable trough are abnormal</li> </ul>   | <ul style="list-style-type: none"> <li>● Check whether the insulation of the cables entering or leaving the Inverter is damaged</li> <li>● Determine whether there is vibration on the mounting bracket</li> <li>● Check whether the copper bars and connecting cable terminals are loose and corroded</li> </ul>                 |
| Load                     | <ul style="list-style-type: none"> <li>● Whether the Inverter running current exceeds the Inverter rating and motor rating for a certain period of time</li> </ul> | <ul style="list-style-type: none"> <li>● Confirm whether the motor parameters are set correctly</li> <li>● Confirm whether the motor is overloaded</li> <li>● Confirm whether the mechanical vibration is too large (normal condition &lt;0.6g)</li> </ul>  |
| Power supply             | <ul style="list-style-type: none"> <li>● Whether the input voltage meets the requirements and whether there is a lack of phase power supply</li> </ul>             | <ul style="list-style-type: none"> <li>● Confirm whether the voltage between any two phases of the input voltage is within the allowable range indicated on the nameplate</li> <li>● Check if there is a large load around to start</li> </ul>  |

## 7.2 Regular Maintenance

Under normal circumstances, it is advisable to conduct regular inspections every 3 months to 6 months, but in actual cases, please determine the actual inspection cycle based on the usage and working environment of each machine.

| Inspection items             | Check the content   | Measures   |
|------------------------------|---|--|
| Complete machine             | <ul style="list-style-type: none"> <li>Whether there is garbage, dirt, dust accumulation on the surface</li> </ul>  | <ul style="list-style-type: none"> <li>Confirm whether the Inverter cabinet is powered off</li> <li>Use a vacuum cleaner to remove rubbish or dust to avoid touching the parts</li> <li>When the surface dirt cannot be removed, can use alcohol to wipe it and wait for it to dry and evaporate completely</li> </ul> |
| Air duct vent                | <ul style="list-style-type: none"> <li>Whether the air duct and heat sink are blocked</li> <li>Whether the fan is damaged</li> </ul>  | <ul style="list-style-type: none"> <li>Clean the air duct</li> <li>Replace the fan</li> </ul>  |
| Electrical connections       | <ul style="list-style-type: none"> <li>Whether there is discoloration of wires and connection parts, and whether the insulation layer is damaged, cracked, discolored and aging</li> <li>Whether the connecting terminals are worn, damaged or loose</li> <li>Ground check</li> </ul> | <ul style="list-style-type: none"> <li>Replace damaged cables</li> <li>Tighten loose terminals and replace damaged terminals</li> <li>Measure the grounding resistance and fasten the corresponding grounding terminal</li> </ul>  |
| Magnetic contactor periphery | <ul style="list-style-type: none"> <li>Whether the suction is not firm or makes abnormal noise during action</li> <li>Whether there are short-circuited, water-stained, swollen, or ruptured peripheral devices</li> </ul>  | <ul style="list-style-type: none"> <li>Replace defective components</li> </ul>   |
| Motor                        | <ul style="list-style-type: none"> <li>Whether the motor has abnormal vibration and abnormal noise</li> </ul>   | <ul style="list-style-type: none"> <li>Tighten mechanical and electrical connections and lubricate motor shaft</li> </ul>  |
| Electrolytic capacitor       | <ul style="list-style-type: none"> <li>Whether the electrolytic capacitor has leakage, discoloration, cracks, and whether the safety valve leaks, expands, or ruptures</li> </ul>   | <ul style="list-style-type: none"> <li>Replace defective components</li> </ul>   |
| Circuit board                | <ul style="list-style-type: none"> <li>Whether there is peculiar smell, discoloration, serious rust, and whether the connector connection is correct and reliable</li> </ul>  | <ul style="list-style-type: none"> <li>Fastener connection</li> <li>Clean the circuit board</li> <li>Replace damaged circuit board</li> </ul>  |
| Keyboard                     | <ul style="list-style-type: none"> <li>Whether the keyboard is damaged and the display is incomplete</li> </ul>   | <ul style="list-style-type: none"> <li>Replace damaged circuit board</li> </ul>  |

### ATTENTION

Do not perform related operations when the power is turned on, otherwise there is a danger of electric shock and death. Please make sure power supply of the Inverter has been cut off, and DC bus voltage has been discharged to 0V prior to maintenance. Never leave screws, gaskets, conductors, tools and other metal articles inside the Inverter. Failure to comply may result in equipment damage. Never modify the interior components of the Inverter in any condition. Failure to comply may result in equipment damage.

### 7.3 Replacement of Vulnerable Parts

Vulnerable parts of Inverter include cooling fan, electrolytic capacitor. The service lives of these parts are subject to environment and working conditions. To maintain a favorable operating environment is conducive to improving the service life of parts and components; routine inspection and maintenance also contributes to effective improvement of parts' service life. To prolong the service life of entire Inverter, the cooling fan, electrolytic capacitor or other vulnerable parts should be subjected to routine inspection according to the table below. Please replace the abnormal parts (if any) in time.

### ATTENTION

- Normally, the cooling fan of the Inverter should be replaced every 2 to 3 years;
- Under normal circumstances, the large-capacity electrolytic capacitor of the Inverter should be replaced every 4 to 5 years;

### 7.4 Storage

When the inverter is not used temporarily or stored for a long time after purchase, the following matters should be paid attention to:

### ATTENTION

- Avoid storing the Inverter in a place with high temperature, humidity or vibration and metal dust, and ensure that the storage place is well ventilated;
- If the Inverter has not been put into use for a long time, the internal filter capacitor characteristics will decline;
- If the Inverter is not used for a long time, it should be powered on once every two years to restore the characteristics of the large-capacity filter capacitor, and the function of the Inverter should be checked at the same time. When energized, the voltage should be gradually increased through an autotransformer, and the energization time should not be less than 5 hours.

## Appendix: Modbus Communication Protocol

PV300series of frequency converters can provide RS232/RS485 communication interface, and use MODBUS communication protocol. The user can realize the central control through computer or PLC. Also it can set the running commands, modify or read the function code parameter, read the working status and fault information of the frequency converter according to the protocol.

### **RTU frame format:**

|                                   |   |
|-----------------------------------|---|
| Frame Header START                | 3.5 characters time   |
| Slave Address ADR                 | Contact address:0~247   |
| The command code CMD              | 03:Read the parameter of the slave machine<br>06:Write the parameters of the slave machine  |
| The content of the data DATA(N-1) | The content of the DATA:<br>The address of function code parameters;<br>The quantity of function code parameters;<br>The value of function code parameters; |
| The content of the data DATA(N-2) |   |
| .....                             |   |
| The content of the data DATA0     |   |
| CRC CHK Low order                 | detection value:CRC16 verified value. low byte is sent previous than High byte.   |
| CRC CHK High order                |   |
| End                               | 3.5-characters time   |

### **1. The Definition of Communication Parameter Address**

This part is the content about communication, which used for controlling the running and working status of the frequency convert, and set relevant parameter.

Parameter of read and write function code (some function code can't be changed, only for supplier and monitor usage)

### **Labeling rule of function code address:**

Use the group number and mark number of the function code as parameter address rule:

The high bytes:F0~:FE (group P)、70~7F (group U) the low byte:00~FF

For example:P0-11,the address indicated as F00B;

### **Attention:**

Group PE:The parameter can neither be read nor be altered.

Group U:The parameter can only be read, but not be altered.

Some parameter can't be changed when the frequency convert is on running status; some parameter can't be changed regardless of any status of the frequency convert; please pay attention to the range, unit and relevant instruction when changing the function code parameter.

| Group number of function code | access address of communication | Function code address of communication revise the RAM |
|-------------------------------|---------------------------------|---|
| Group P0~PE                   | 0xF000~0xFFFF                   | 0x0000~0x0EFF   |
| Group U0                      | 0x70000~0x70FF                  |   |

Pay attention that if the EEPROM is stored continuously, the service life will be reduced. So there is no need to store some function code on the communication mode, just need to change the value in RAM.

If it's group P of the parameter to realize this function, just need to change high byte from F to 0 on the function code address.

The relevant function code address indicated as below: High byte: 00~0F (group P) the low byte: 00~FF.

For example: function code P0-11 doesn't store in EEPROM, the address indicated as 000B; this address means that it only can write RAM, but can't use the read action, if it's being read, the address is ineffective.

#### Communication Control Parameter Group Address Description

| Parameter Address (HEX) | Parameter Description           | Data description   | Property |
|-------------------------|---------------------------------|--|----------|
| 0x1000                  | Communication frequency setting | 0~1000 Correspondence 0~100.0%   | R/W      |
| 0x1001                  | Running frequency               | Unit:0.01hz  | R        |
| 0x1002                  | Bus voltage                     | Unit:0.1V  | R        |
| 0x1003                  | Output voltage                  | Unit:0.1V  | R        |
| 0x1004                  | Output current                  | Unit:0.1A  | R        |
| 0x1005                  | Output power                    | Unit:0.1kW   | R        |
| 0x1006                  | Output torque                   | Unit:0.1%  | R        |
| 0x1007                  | Motor speed                     | Unit:1rpm  | R        |
| 0x1008                  | Communication command setting   | 0000H:No order<br>0001H:Forward operation<br>0002H:Reverse operation<br>0003H:Forward jog<br>0004H:Reverse jog<br>0005H:Slow-down stop<br>0006H:Free stop<br>0007H:Fault reset<br>0008H:Run the prohibit command<br>0009H:Run the permit command | R/W      |
| 0x1009                  | Inverter operation status       | Bit0 0:Stop 1:Run<br>Bit1 0:non-accelerated state 1:accelerated state  | R        |

|        |  |   |     |
|--------|--|---|-----|
|        |  | Bit2<br>0:non-deceleration state<br>1:deceleration state<br>Bit3<br>0:Forward operation      1:Reverse<br>operation<br>Bit4    0:True            1:False  |     |
| 0x100A | Inverter Error Codes   | Inverter Current Error Codes  | R   |
| 0x100B | Upper limit frequency communication given                    | 0~32000 corresponds to 0~320.00hz   | R/W |
| 0x100C | VF Separate output voltage communication given               | 0~32000 corresponds to 0~320.00hz   | R/W |
| 0x100D | PID setting communication setting                            | 0~1000 Correspondence 0~100.0%  | R/W |
| 0x100E | PID feedback communication settings                          | 0~1000 Correspondence 0~100.0%  | R/W |
| 0x100F | Target torque communication given                            | 0~1000 Correspondence 0~100.0%  | R/W |
| 0x1010 | Torque control forward maximum frequency communication given | 0~1000 Correspondence 0~100.0%  | R/W |
| 0x1011 | Torque Control Reverse Maximum Frequency Communication Given | 0~1000 Correspondence 0~100.0%  | R/W |
| 0x1012 | Output terminal status                                       | Bit0    0:T1 False            1:T1 True<br>Bit1    0:T2 False            1:T2 True<br>Bit2    0:T3 False            1:T3 True<br>Bit3    0:DO1 False          1:DO1 True<br>Bit4    0:DO2 False          1:DO2 True | R/W |
| 0x1013 | AO1 output given   | 0~1000 Correspondence 0~10.00V  | R/W |
| 0x1014 | AO2 output given   | 0~1000 Correspondence 0~10.00V  | R/W |
| 0x1015 | HDO output given   | 0~1000 Correspondence 0~100.0%  | R/W |
| 0x1016 | Motor electric torque upper limit given                      | 0~1000 Correspondence 0~100.0%  | R/W |

**Example 1:**read the run frequency of the first machine: 0x01 0x03 0x10 0x01 0x00 0x01 0x21 0x0A 0x10 0x01 (1001) run frequency address, 0x00 0x01 (0001) one data 0x21 0x0A (0A21) CRC verified value.

**Example 2:**read the busbar voltage, output voltage, output current of the first machine at the same time: 0x01 0x03 0x10 0x02 0x00 0x03 CRC verified value, the meaning of the data is similar to example 1.
